⁴ Summary

⁵ The forces on stars, galaxies, and dark matter under external gravitational fields lead to the
⁶ dynamical evolution of structures in the universe. The orbits of these bodies are therefore key
⁷ to understanding the formation, history, and future state of galaxies. The field of “galactic
⁸ dynamics,” which aims to model the gravitating components of galaxies to study their structure
⁹ and evolution, is now well-established, commonly taught, and frequently used in astronomy.
¹⁰ Aside from toy problems and demonstrations, the majority of problems require efficient
¹¹ numerical tools, many of which require the same base code (e.g., for performing numerical
¹² orbit integration).

¹³ Gala is an Astropy-affiliated Python package for galactic dynamics. Python enables wrapping
¹⁴ low-level languages (e.g., C) for speed without losing flexibility or ease-of-use in the user-
¹⁵ interface. The API for Gala was designed to provide a class-based and user-friendly interface
¹⁶ to fast (C or Cython-optimized) implementations of common operations such as gravitational
¹⁷ potential and force evaluation, orbit integration, dynamical transformations, and chaos
¹⁸ indicators for nonlinear dynamics. Gala also relies heavily on and interfaces well with the
¹⁹ implementations of physical units and astronomical coordinate systems in the Astropy package
²⁰ ([Astropy Collaboration et al., 2013](#)) (`astropy.units` and `astropy.coordinates`).

²¹ Gala was designed to be used by both astronomical researchers and by students in courses
²² on gravitational dynamics or astronomy. It has already been used in a number of scientific
²³ publications ([Pearson et al., 2017](#)) and has also been used in graduate courses on Galactic
²⁴ dynamics to, e.g., provide interactive visualizations of textbook material ([Binney & Tremaine,
2008](#)). The combination of speed, design, and support for Astropy functionality in Gala will
²⁵ enable exciting scientific explorations of forthcoming data releases from the *Gaia* mission ([Gaia
Collaboration et al., 2016](#)) by students and experts alike. The source code for Gala has been
²⁶ archived to Zenodo with the linked DOI: ([Price-Whelan et al., 2017](#))

²⁹ Acknowledgements

³⁰ We acknowledge contributions from Brigitta Sipocz, Syrtis Major, and Semyeong Oh, and
³¹ support from Kathryn Johnston during the genesis of this project.
